## 1 Initial Analysis

### 1.1 Elements

When first analyzing a system of linear equations, you can characterize it based in a number of factors listed below.

$n \rightarrow$  Number of equations

$m \rightarrow$  Number of unknown elements

### 1.2 Classifying the system

After knowing the elements of the system, one can classify it accordingly:

- Independent system: Has exactly one solution ( $m = n$ ).
- Dependent system: Has infinitely many solutions ( $m > n$ ).
- Inconsistent: Has no solution ( $m < n$ )

## 2 Choosing the solution method

### 2.1 Types of methods

The methods used in solving linear systems can be divided into 2 major groups.

- Direct:
- Indirect:

## 3 Finally... Using the method of choice

### 3.1 Gauss Elimination

To use this method, one needs to find an equivalent system to the one being solved
